Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[0001] This invention is concerned with curable compositions, more particularly compositions which cure upon exposure to UV radiation. The invention is particularly concerned with compositions comprising friction reducing additives. The invention also relates to a method for making said additives.

[0002] Curable compositions are well known and have been described in many publications. They are used for a variety of applications, including sealants, protective coatings, encapsulants and printing. The present invention, though applicable to many types of curable compositions, is particularly concerned with protective coatings, more specifically varnishes, eg overprint varnishes.

[0003] In the manufacture of packaging, eg boxes, or packaging material it is desirable to have low friction between slidable surfaces, eg, between the surfaces of the various elements of a production line and packaging or packaging material. It is therefore desirable to impart to the surface of packaging material a degree of lubricity which will prevent sticking and abrasion damage. Accordingly, packaging material can be coated with certain coating compositions comprising additives based on silicone-alkylene oxide copolymers which, when cured, have a low coefficient of friction.

[0004] However, coating compositions containing the said additives tend to lack consistency of performance, that is, the coefficient of friction tends to fluctuate upward and/or downward as a function of time. This inconsistency in performance is believed to be a result of the additives, which are low viscosity liquids, migrating away from the surface of a cured coating composition. This causes problems to manufacturers who calibrate their machinery according to the frictional force between slidable surfaces. Additionally, the additives may migrate to an adhesive coated surface, eg, an adhesive seal of a box, which may adversely affect the adhesive seal over a period of time.

[0005] Friction reducing additives are known which display a reduced tendency to migrate within a coating composition to which they are applied. This is achieved by adding certain functionality to the friction reducing additives which enables an additive to react into the coating composition during cure. However, the processes of producing these friction reducing additives tend to involve relatively complex syntheses.

[0006] There remains a need to provide improved curable compositions which comprise friction reducing additives, which can be made through relatively uncomplicated synthetic routes, capable of imparting to cured compositions reduced coefficients of friction with consistent performance.

[0007] We have now found that we can provide improved curable compositions by adding friction reducing additives, which may be reactive or unreactive, with the curable composition itself. The said additives may be produced by a relatively uncomplicated synthetic pathway.

[0008] According to the invention there is provided a curable composition comprising an additive which is a polysiloxane (A) comprising at least one unit (i) $R_aSiO_{(4-a)/2}$ and at least one unit (ii) $R_bR^1SiO_{(3-b)/2}$ wherein R represents a monovalent hydrocarbon or substituted hydrocarbon group having from 1 to 12 carbon atoms, R^1 represents a group of the formula $-(CH_2)_n(OR^2)_mX$ where R^2 is an alkylene unit having 2 or 3 carbon atoms, X is a group of the formula $-OCOCR^3=CH_2$ where R^3 is a hydrogen, a methyl group or an ethyl group, a is 0, 1, 2 or 3 and b is 0, 1 or 2, n has a value of 2 to 5 and m has a value of from 8 to 50.

[0009] In the Derwent abstract of JP 05210883 is disclosed a protective film for photomagnetic discs comprising a curable compositions and a polyethylene oxide-ethylene glycol modified silicone compound of the formula

to prevent surface scratching by providing a coating with a low coefficient of friction. No details of the values of k , l , m or n are available in the abstract, but no indication is given that the particular values for m and n are important or should be as indicated for the polysiloxane to be used in the compositions according to the invention, nor is there any suggestion that improvements can be obtained by providing (meth)acrylic groups to such polysiloxane.

[0010] JP-A-5-132557 describes a radiation curable coating composition containing the polysiloxane compound of

the formula

where R¹ and R² are H or methyl; x = 0-200, y = 4-30, z = 1-40 and j = 1-50.

[0011] US-A-5296625 describes silicone carboxylated esters which have terminal carboxyl groups and are prepared by reacting a hydroxyl-containing silicone polymer and an anhydride.

[0012] In another of its aspects, the invention provides the use of a polysiloxane comprising at least one unit (i) R_aSiO_{(4-a)/2} and at least one unit (ii) R_bR¹SiO_{(3-b)/2} wherein R represents a monovalent hydrocarbon or substituted hydrocarbon group having from 1 to 12 carbon atoms, R¹ represents a group of the formula -(CH₂)_n(OR²)_mX where R² is an alkylene unit having 2 or 3 carbon atoms, a is 0, 1, 2 or 3 and b is 0, 1 or 2, and X is a group of the formula -OCOCR³=CH₂ where R³ is a hydrogen atom, a methyl group or an ethyl group, n has a value of 2 to 5 and m has a value of from 8 to 50, as a friction reducing additive in curable compositions, particularly in UV curable coating compositions.

[0013] The polysiloxane comprised in the compositions according to the invention or used as a friction reducing additive according to the invention may be linear or branched or a mixture thereof. The polysiloxanes may be low viscosity liquid materials but preferably are higher viscosity materials, even waxy solids or solid materials. These polysiloxanes are preferably materials which are waxy solids at a temperature of about 40°C.

[0014] It is preferred that the polysiloxanes have at least one unit according to formula (ii) wherein b has the value of 2, which means that at least one unit comprising a R¹ substituent is an end-blocking unit of the polysiloxane. More preferably the polysiloxanes are linear polyorganosiloxanes having for both terminal groups a siloxane group having one R¹ substituent of the formula -(CH₂)_n(OR²)_m-X connected to a silicon atom through a silicon-carbon linkage. Most preferably the polysiloxanes are linear materials consisting of siloxane units of the formula (i) for all parts of the chain, except for the end-blocking units which would be units of the formula (ii). Preferably R is an alkyl group, more preferably a lower alkyl group having up to 6 carbon atoms, most preferably a methyl group. Preferably X is not a hydroxyl group.

[0015] The weight proportion of the group -(CH₂)_n(OR²)_mX in the polysiloxanes used in the compositions according to the invention is preferably from 30% to 70%, more preferably 40% to 60%, most preferably about 50% by weight of the total weight of the polysiloxane. This will give a better friction reducing ability. The polyalkylene oxide moiety, (OR²)_m, may be polyethylene oxide or polypropylene oxide or a copolymer of polyethylene and polypropylene oxide. Advantageously the polyalkylene oxide is a polyethylene oxide.

[0016] Particularly preferred polysiloxanes for use in compositions according to the invention are polydiorganosiloxanes represented by the general formula (Z)

wherein at least 80% of the groups R are methyl and X is OCOCR³=CH₂, n is 3, m is 8 to 50 and p is from 10 to 50, provided that the values of m and p are such that the alkylene oxide moiety does not constitute less than 30% and not more than 70% of the total weight of the polysiloxane. It is preferred that the value of p is from 20 to 30. Where X is a

hydroxyl group, it is particularly preferred that \underline{n} is 3, \underline{m} is 18 and \underline{p} is 22. Examples of suitable polydiorgano-siloxanes having the formula (Z) include those polydiorgano-siloxanes in which \underline{n} is 3, \underline{m} is 36 and \underline{p} is 50 or \underline{n} is 3, \underline{m} is 8 and \underline{p} is 12.

[0017] The invention provides in yet another of its aspects a process for the formation of the polysiloxane additive (A) as described above for use in compositions according to the invention, wherein X denotes a group -OCOCR³=CH₂, said process comprising the steps of (I) reacting a polysiloxane (B) having units according to the formula (i) R_aSiO_{(4-a)/2} and (iii) R_bHSiO_{(3-b)/2}, wherein R, \underline{a} and \underline{b} are as defined above, with an unsaturated hydroxy polyoxyalkylene CH₂=CH₂R⁴_q(OR²)_mOH in the presence of a noble metal catalyst and (II) reacting the product thereof with a carboxylic acid anhydride according to the formula (iv)

wherein R² is as defined above, R³ is preferably methyl, R⁴ is a divalent group -(CH₂)-, \underline{q} is 0 or 1 and \underline{m} is from 8 to 50.

[0018] Step (I) of a process according to the invention is a noble metal catalysed hydrosilylation reaction of a polysiloxane (B) with an unsaturated hydroxy polyoxyalkylene CH₂=CHR⁴_q-(OR²)_mOH, preferably CH₂=CHR⁴_q(OCH₂CH₂)_mOH, for example CH₂=CH(CH₂)₂(OCH₂CH₂)₁₈OH, at a preferred temperature of about 50 to 150°C.

[0019] The polysiloxane (B) may be a polysiloxane having a structure which is linear or branched or a mixture of such structures may be used and has a molecular weight which is preferably from 900 to 4000 such that it has a viscosity of about 10 to 100 mm²/s at 25°C. A preferred polysiloxane (B) is a linear polyorganosiloxane, more preferably a polydimethylsiloxane comprising dimethylsilyl (-Si(CH₃)₂H) terminal groups.

[0020] The noble metal catalyst which is preferably a rhodium or platinum containing compound or complex, may be any active hydrosilylation catalyst, many of which are known in the art. A preferred catalyst is chloroplatinic acid in the form of the commonly available hexahydrate or in its anhydrous form. Platinum complexes may also be used, eg those materials prepared from chloroplatinic acid hexahydrate and divinyl tetramethyldisiloxane.

[0021] The product of the aforementioned hydrosilylation reaction step (I) is a polysiloxane similar to (A) described above, but wherein X is a hydroxyl group.

[0022] Step (II) of a process according to the invention involves the reaction of the resulting polysiloxane where X denotes a hydroxyl group with a carboxylic acid anhydride according to formula (iv).

[0023] The second step of the reaction is preferably conducted at a temperature of from 60 to 110°C, most preferably in a solvent which does not interfere with the desired course of reaction. Suitable solvents include toluene, xylene and cyclohexane. The polysiloxane resulting from step (I) may be isolated from the crude reaction mixture resultant from step (I) to be provided as a pure component, although no deleterious effect is observed to the course of reaction of step (II) if that polysiloxane is used directly, in its impure form, as part of the crude reaction mixture resultant from step (I).

[0024] The curable compositions comprising the friction reducing additive polysiloxanes hereinabove defined find utility as varnishes, for example overprint varnishes. It is accordingly preferred that the curable composition according to the invention is a curable coating composition, preferably an overprint varnish.

[0025] A curable coating composition according to the invention may comprise polyacrylated polymers known in the art. Preferred polyacrylated polymers include, polyester acrylates, epoxy acrylates and urethane acrylates. Curable coating compositions according to the invention may be cured by radiation, for example ultraviolet radiation or electron beam radiation. For those curable coating compositions curable by ultraviolet radiation the presence of a photoinitiator is desirable. Any of the known photoinitiators may be used, for example benzophenone, either alone or in conjunction with others, eg Davacur® 1173. The photoinitiator may be present in proportions of from 2 to 10 parts by weight per 100 parts of the total curable composition.

[0026] The skilled person will realise that a photoactivator can be used in combination with the aforementioned photoinitiator and that synergistic effects can be observed when said combinations are used. Photoactivators useful in a curable coating composition according to the invention are known in the art and include alkyl amines, eg methylamine, tributylamine and cyclohexylamine, however, we prefer to use an amine modified monoacrylated polyester. The photoactivator may also be present in the overprint varnish composition in proportions of from 2 to 10 parts by weight per 100 parts of the polyacrylated polymer.

[0027] Polysiloxanes for use in the curable compositions according to the invention may be present in amounts of from 0.1 to 3.0% by weight and preferably 0.2 to 1.0% by weight based on the total weight of composition, eg the overprint varnish. However, as the preferred polysiloxanes are waxy solid materials, which are not as easy to dispense and formulate into liquid systems, it is preferred that those polysiloxanes are provided in conjunction with a carrier

material. Suitable carrier materials are manifold, but preferred ones include low molecular weight silicone polyethers such as polydiorganosiloxane polyoxyalkylene copolymers, particularly those with a short siloxane backbone (eg up to 6 silicon atoms) and an oxyalkylene content of from 30 to 50% by weight. Alternative carrier materials include reactive diluents for the overprint varnishes, eg those supplied by Arcos®. Other alternative carriers include solvents, eg toluene, xylene, isoparaffin, more preferably however, aprotic solvents, eg propylene carbonate and dipropylene glycol dimethyl ether.

[0028] Other adjuvants may be present in curable coating compositions according to the invention, for example dyes, wetting agents and other additives known in the art of coating compositions.

[0029] Cured coating compositions according to the invention exhibit a low coefficient of friction. Additionally, the cured coatings maintain a consistently low coefficient of friction over time. The consistency of performance is believed to be a result of the additive reacting into the coating composition, eg overprint varnish during cure and consequently being immobilised therein. This is particularly surprising where those polysiloxanes are used where X denotes a hydroxyl group, as one considers that polysiloxane to be an unreactive additive not possessing acrylate functionality.

[0030] When the friction reducing additive polysiloxanes are added as a component to the curable coating compositions according to the present invention in proportions of about 0.1% by weight based on the total weight of the overprint varnish, they have the additional surprising benefit that they increase the gloss finish of the coating composition. Significantly larger proportions of the friction reducing additive polysiloxanes, i.e. up to about 2% by weight does not detract from the gloss finish or the clarity of the cured coating composition, but it is preferred not to exceed the 2% addition level if gloss is to be maintained. Gloss is advantageous as a glossy, clear coat adds to the eye appeal of packaging and the like.

[0031] The curable coating compositions of this invention are particularly well suited to forming coatings on fibrous and cellulosic substrates or on plastics coated fibrous or cellulosic substrates, although they can also be applied to other substrates, eg metal. The curable coating compositions can be applied over substrates having conventional printing inks printed thereon and cured by exposure to radiation to provide a protective overprint for printed matter, eg publications, posters, packaging and the like.

[0032] Curable coating compositions may be applied as thin coatings to suitable substrates by any of the known methods suitable for the application of such coatings, for example roll coating, gravure coating, doctor blade, spraying or brushing.

[0033] There now follow a number of examples which illustrate the invention, and which need to be read in conjunction with the drawings, of which Figures 1 to 4 are graphs showing the evolution of the coefficient of friction from a number of compositions, as identified in the Examples, with time.

Example 1 - Part(a)

[0034] 176.8g of an allyl end-blocked polyethylene glycol, 0.28g of a platinum complex (sufficient to give 5×10^{-5} moles Pt/mole SiH), and 300g of toluene were charged to a flask fitted with a condenser, nitrogen inlet and thermometer. The mixture was heated to 90°C before slowly adding over a period of 2 hours 169.8g of a polydimethylsiloxane having a chainlength of 22 siloxane units endblocked with dimethylsiloxy groups. The mixture was held at a temperature of 90 to 112°C until all residual SiH was consumed, which was measured by regular sampling and infrared spectroscopy. The resultant reaction mixture was worked-up by removing the solvent under reduced pressure of 100mBar at a maximum temperature of 135°C. The resultant product was allowed to cool to a temperature of 45°C before being poured into a receiving flask. 340.3g of product was obtained as an off-white waxy solid, of 98% purity. Analysis of the product showed it to have the average formula

Example 1 - Part(b)

[0035] The procedure of Part(a) was followed up to, but not including, the work-up procedure. The reaction mixture of Example 1(a) was allowed to cool to 60°C before adding 16.1g of methacrylic acid anhydride slowly over a period of 5 minutes. The reaction mixture was then allowed to cool to 25°C over a 2 hour period (this process was carried out in the absence of light although it could be carried out in an amber glass reactor). The resultant reaction mixture was worked-up in accordance with the procedure of Part(a). The product obtained was an off-white waxy solid at 25°C. Analysis of the product showed it to have the general formula

**Example 2**Illustrative Coating Composition 1

[0036] 0.5 weight % of the siloxane polymer of Example 1(b) was added to 100g of the model varnish composition (PHOTOMER®, supplied by Harcros Chemical group and comprising 83 parts of a tetra-functional acrylated polyester, 10 parts of an amine modified monofunctional acrylated ester, 5 parts of benzophenone and 2 parts of Davacur® 1173). The curable coating composition thus formed was coated onto paper substrate (Cham Tenero HiFi No.1, clay coated paper) by a Euclid® coating machine, to a coat weight of from 3 to 4 g/m². The coated paper was irradiated with a UV source by passing it under a medium power mercury lamp with an output of 300W per square inch at a rate of 40 m/minute. The dynamic coefficient of friction of the cured coating was measured according to a modification of the DIN 53375 test method using a 200g sledge. The results are shown in figure 1.

Comparative Coating Composition 1

[0037] 0.5 weight % of a friction reducing additive consisting of a liquid polysiloxane having the formula R⁵ (Me₂SiO)₁₉SiMe₂R⁵, wherein Me is methyl and R⁵ is the group -(CH₂)₃(OE)₁₉(OP)₅OH, wherein OE is a divalent ethylene oxide radical and OP is a divalent propylene oxide radical was added to 100g of the model varnish composition. The resultant coating composition was coated onto paper and cured according to the method described above. The coefficient of friction of the cured coating as a function of time is shown in figure 2.

Comparative Coating Composition 2

[0038] 0.5 weight % of a friction reducing additive consisting of a liquid polysiloxane having the formula R⁶ (Me₂SiO)₁₄SiMe₂R⁶, wherein R⁶ represents the group -(CH₂)₃(OE)₁₂OH was added to the model varnish composition. The resultant coating composition was coated onto paper, cured and tested according to the method described above. The coefficient of friction of the cured coating as a function of time is shown in figure 3. It can be seen that the comparative results give a greater variation of coefficient of friction than those according to the invention.

Claims

1. A curable composition comprising an additive which is a polysiloxane comprising at least one unit (i) R_aSiO_{(4-a)/2} and at least one unit (ii) R_bR¹SiO_{(3-b)/2} wherein R represents a monovalent hydrocarbon or substituted hydrocarbon group having from 1 to 12 carbon atoms, R¹ represents a group of the formula -(CH₂)_n(OR²)_mX where R² is an alkylene unit having 2 or 3 carbon atoms, a is 0, 1, 2 or 3 and b is 0, 1 or 2 **characterised in that** X is a group of the formula -OCOCR³=CH₂ where R³ is hydrogen, a methyl group or an ethyl group, n has a value of 2 to 5 and m has a value of from 8 to 50.
2. A curable composition according to Claim 1 further **characterised in that** at least one unit (ii) wherein b has the value 2, is present in the polysiloxane additive.
3. A curable composition according to Claim 1 or 2, further **characterised in that** the polysiloxane additive is a substantially linear polymer consisting essentially of units of the formula (i) wherein a has the value of 2 and of two units (ii) wherein b has the value of 2, the units (ii) being present as end-blocking units of the polysiloxane.
4. A curable composition according to any one of the preceding claims further **characterised in that** the weight proportion of the group -(CH₂)_n(OR²)_mX in the polysiloxane additive is from 30% to 70% of the total weight of the polysiloxane additive.
5. A curable composition according to any one of the preceding claims further **characterised in that** the poly-siloxane additive is represented by the general formula

wherein R, R², X, n and m are as defined above, at least 80% of the groups R are methyl and p is from 10 to 50, provided that the total weight of the -(CH₂)_n(OR²)_mX moieties does not constitute less than 30% and not more than 70% of the total weight of the polysiloxane additive.

6. A curable composition according to any one of the preceding claims **characterised in that** the composition also comprises a carrier material selected from low molecular weight silicone polyethers, reactive diluents for overprint varnishes, solvents or aprotic solvents.
7. The use of a polysiloxane comprising at least one unit (i) R_aSiO_{(4-a)/2} and at least one unit (ii) R_bR¹SiO_{(3-b)/2} wherein R represents a monovalent hydrocarbon or substituted hydrocarbon group having from 1 to 12 carbon atoms, R¹ represents a group of the formula -(CH₂)_n(OR²)_mX where R² is an alkylene unit having 2 or 3 carbon atoms, a is 0, 1, 2 or 3 and b is 0, 1 or 2, and X is a group of the formula -OCOCR³=CH₂ where R³ is hydrogen, a methyl group or an ethyl group, n has a value of 2 to 5 and m has a value of from 8 to 50, as a friction reducing additive in curable compositions, particularly in UV curable coating compositions.
8. A process for the formation of a polysiloxane comprising at least one unit (i) R_aSiO_{(4-a)/2} and at least one unit (ii) R_bR¹SiO_{(3-b)/2} wherein R represents a monovalent hydrocarbon or substituted hydrocarbon group having from 1 to 12 carbon atoms, R¹ represents a group of the formula -(CH₂)_n(OR²)_mX where R² is an alkylene unit having 2 or 3 carbon atoms, a is 0, 1, 2 or 3 and b is 0, 1 or 2, and X is a group of the formula -OCOCR³=CH₂ where R³ is hydrogen, a methyl group or an ethyl group, n has a value of 2 to 5 and m has a value of from 8 to 50, **characterised in that** the process comprises the steps of (I) reacting a polysiloxane (B) having units according to the formula R_aSiO_{(4-a)/2} (i) and R_bHSiO_{(3-b)/2} (iii) with an unsaturated hydroxy polyoxyalkylene of the formula CH₂=CHR⁴_q(OR²)_mOH in the presence of a noble metal catalyst and (II) reacting the product thereof with a carboxylic acid anhydride according to the formula

- wherein R³ is as defined above, R⁴ is a methylene group, q is 0 or 1 and m is from 8 to 50.
9. A process according to Claim 8, further **characterised in that** step (I) is a noble metal catalysed hydrosilylation reaction of a polysiloxane (B) with an unsaturated polyoxy-alkylene CH₂=CHR⁴_q(OCH₂CH₂)_mOH at a temperature of 50 to 150°C and **in that** step (II) is conducted at a temperature of from 60 to 110°C.
10. An overprint varnish composition **characterised in that** the composition comprises the composition of any one of Claims 1 to 6 and further comprises polyacrylated polymers, selected from polyester acrylates, epoxy acrylates and urethane acrylates.
11. An overprint varnish composition according to Claim 10 further **characterised in that** the polysiloxane additive is present in an amount of from 0.1 to 3.0% by weight based on the total weight of the composition.
12. A method of coating a substrate with a curable composition according to any one of Claims 1 to 6 or an overprint varnish composition according to Claim 10 or 11 **characterised by** the application of the curable composition onto the substrate and thereafter curing the coating on the substrate by exposure of the coated composition to ultra-violet radiation or to electron beam radiation.
13. A method of improving the gloss of an overprint varnish, **characterised in that** it comprises including in the varnish from 0.1 to 2% by weight, based on the total composition of the varnish of a polysiloxane additive comprising at least one unit R_aSiO_{(4-a)/2} (i) and at least one unit R_bR¹SiO_{(3-b)/2} (ii) wherein R represents a monovalent hydrocarbon or substituted hydrocarbon group having from 1 to 12 carbon atoms, R¹ represents a group of the formula -(CH₂)_n(OR²)_mX where R² is an alkylene unit having 2 or 3 carbon atoms, a is 0, 1, 2 or 3 and b is 0, 1 or 2, and X is a group of the formula -OCOCR³=CH₂ where R³ is hydrogen, a methyl group or an ethyl group, n has a value

of 2 to 5 and m has a value of from 8 to 50.

Patentansprüche

1. Härtbare Zusammensetzung, enthaltend ein Additiv, welches ein Polysiloxan ist, das mindestens eine Einheit (i) $R_aSiO_{(4-a)/2}$ und mindestens eine Einheit (ii) $R_bR^1SiO_{(3-b)/2}$ enthält, worin R eine monovalente Kohlenwasserstoff- oder substituierte Kohlenwasserstoffgruppe mit 1 bis 12 Kohlenstoffatomen darstellt, R^1 eine Gruppe der Formel $-(CH_2)_n(OR^2)_mX$ darstellt, worin R^2 eine Alkyleneinheit mit 2 oder 3 Kohlenstoffatomen ist, a gleich 0, 1, 2 oder 3 ist und b gleich 0, 1 oder 2 ist, **dadurch gekennzeichnet, dass** X eine Gruppe der Formel $-OCOCR^3=CH_2$ ist, worin R^3 gleich Wasserstoff, eine Methylgruppe oder eine Ethylgruppe ist, n einen Wert von 2 bis 5 aufweist und m einen Wert von 8 bis 50 aufweist.
2. Härtbare Zusammensetzung nach Anspruch 1, weiterhin **dadurch gekennzeichnet, dass** mindestens eine Einheit (ii), worin b den Wert 2 aufweist, in dem Polysiloxanadditiv vorhanden ist.
3. Härtbare Zusammensetzung nach Anspruch 1 oder 2, weiterhin **dadurch gekennzeichnet, dass** das Polysiloxanadditiv ein im wesentlichen lineares Polymer ist, das im wesentlichen aus Einheiten der Formel (i), worin a den Wert von 2 aufweist, und aus zwei Einheiten (ii), worin b den Wert von 2 aufweist, besteht, wobei die Einheiten (ii) als endblockierende Einheiten des Polysiloxans vorhanden sind.
4. Härtbare Zusammensetzung nach einem der vorstehenden Ansprüche, weiterhin **dadurch gekennzeichnet, dass** der Gewichtsanteil der Gruppe $-(CH_2)_n(OR^2)_mX$ in dem Polysiloxanadditiv von 30 bis 70% des Gesamtgewichts des Polysiloxanadditivs reicht.
5. Härtbare Zusammensetzung nach einem der vorstehenden Ansprüche, weiterhin **dadurch gekennzeichnet, dass** das Polysiloxanadditiv durch die allgemeine Formel

dargestellt wird, worin R, R^2 , X, n und m wie oben definiert sind und wobei mindestens 80% der Gruppen R Methyl sind und p von 10 bis 50 reicht, unter der Voraussetzung, dass das Gesamtgewicht der $-(CH_2)_n(OR^2)_mX$ -Einheiten nicht weniger als 30% und nicht mehr als 70% des Gesamtgewichts des Polysiloxanadditivs ausmacht.

6. Härtbare Zusammensetzung nach einem der vorstehenden Ansprüche, **dadurch gekennzeichnet, dass** die Zusammensetzung weiterhin ein Trägermaterial enthält, das aus niedermolekularen Siliconpolyethern, reaktiven Verdünnungsmitteln für Überdrucklacke, Lösungsmitteln oder aprotischen Lösungsmitteln ausgewählt ist.
7. Verwendung eines Polysiloxans, das mindestens eine Einheit (i) $R_aSiO_{(4-a)/2}$ und mindestens eine Einheit (ii) $R_bR^1SiO_{(3-b)/2}$ enthält, worin R eine monovalente Kohlenwasserstoff- oder substituierte Kohlenwasserstoffgruppe mit 1 bis 12 Kohlenstoffatomen darstellt, R^1 eine Gruppe der Formel $-(CH_2)_n(OR^2)_mX$ darstellt, worin R^2 eine Alkyleneinheit mit 2 oder 3 Kohlenstoffatomen ist, a gleich 0, 1, 2 oder 3 ist und b gleich 0, 1 oder 2 ist und X eine Gruppe der Formel $-OCOCR^3=CH_2$ ist, worin R^3 gleich Wasserstoff, eine Methylgruppe oder eine Ethylgruppe ist, n einen Wert von 2 bis 5 aufweist und m einen Wert von 8 bis 50 aufweist, als ein Reibung reduzierendes Additiv in härtbaren Zusammensetzungen, insbesondere in UV-härtbaren Beschichtungszusammensetzungen.
8. Verfahren zur Bildung eines Polysiloxans, das mindestens eine Einheit (i) $R_aSiO_{(4-a)/2}$ und mindestens eine Einheit (ii) $R_bR^1SiO_{(3-b)/2}$ enthält, worin R eine monovalente Kohlenwasserstoff- oder substituierte Kohlenwasserstoffgruppe mit 1 bis 12 Kohlenstoffatomen darstellt, R^1 eine Gruppe der Formel $-(CH_2)_n(OR^2)_mX$ darstellt, worin R^2 eine Alkyleneinheit mit 2 oder 3 Kohlenstoffatomen ist, a gleich 0, 1, 2 oder 3 ist und b gleich 0, 1 oder 2 ist und X eine Gruppe der Formel $-OCOCR^3=CH_2$ ist, worin R^3 gleich Wasserstoff, eine Methylgruppe oder eine Ethylgruppe ist, n einen Wert von 2 bis 5 aufweist und m einen Wert von 8 bis 50 aufweist, **dadurch gekennzeichnet, dass** das Verfahren die Schritte umfasst: (I) Umsetzen eines Polysiloxans (B) mit Einheiten gemäß der Formel $R_aSiO_{(4-a)/2}$ (i) und $R_bHSiO_{(3-b)/2}$ (iii) mit einem ungesättigten Hydroxypolyoxyalkylen der Formel $CH_2=CHR^4_q(OR^2)_mOH$ in Gegenwart eines Edelmetallkatalysators und (II) Umsetzen des Produkts daraus mit einem Carbonsäureanhydrid gemäß der Formel

worin R³ wie oben definiert ist, R⁴ eine Methylengruppe ist, q gleich 0 oder 1 ist und m von 8 bis 50 reicht.

9. Verfahren nach Anspruch 8, weiterhin **dadurch gekennzeichnet, dass** Schritt (I) eine edelmetallkatalysierte Hydrosilylierungsreaktion eines Polysiloxans (B) mit einem ungesättigten Polyoxyalkylen CH₂=CHR⁴_q (OCH₂CH₂)_mOH bei einer Temperatur von 50 bis 150°C ist und dass Schritt (II) bei einer Temperatur von 60 bis 110°C durchgeführt wird.
10. Überdrucklackzusammensetzung, **dadurch gekennzeichnet, dass** die Zusammensetzung die Zusammensetzung nach einem der Ansprüche 1 bis 6 enthält und weiterhin polyacrylierte Polymere, ausgewählt aus Polyesteracrylaten, Epoxyacrylaten und Urethanacrylaten, enthält.
11. Überdrucklackzusammensetzung nach Anspruch 10, weiterhin **dadurch gekennzeichnet, dass** das Polysiloxanadditiv in einer Menge von 0,1 bis 3,0 Gew.-%, bezogen auf das Gesamtgewicht der Zusammensetzung, vorhanden ist.
12. Verfahren zur Beschichtung eines Substrats mit einer härtbaren Zusammensetzung gemäss einem der Ansprüche 1 bis 6 oder einer Überdrucklackzusammensetzung nach Anspruch 10 oder 11, **gekennzeichnet durch** die Auftragung der härtbaren Zusammensetzung auf das Substrat und anschließende Härtung der Beschichtung auf dem Substrat **durch** Aussetzen der aufgetragenen Zusammensetzung an ultraviolette Strahlung oder Strahlung eines Elektronenstrahls.
13. Verfahren zur Verbesserung des Glanzes eines Überdrucklackes, **dadurch gekennzeichnet, dass** es Einfügung in den Lack von 0,1 bis 2 Gew.-%, bezogen auf die Gesamtzusammensetzung des Lackes, eines Polysiloxanadditivs, enthaltend mindestens eine Einheit R_aSiO_{(4-a)/2} (i) und mindestens eine Einheit R_bR¹SiO_{(3-b)/2} (ii), worin R eine monovalente Kohlenwasserstoff- oder substituierte Kohlenwasserstoffgruppe mit 1 bis 12 Kohlenstoffatomen darstellt, R¹ eine Gruppe der Formel -(CH₂)_n(OR²)_mX darstellt, worin R² eine Alkyleneinheit mit 2 oder 3 Kohlenstoffatomen ist, a gleich 0, 1, 2 oder 3 ist und b gleich 0, 1 oder 2 ist und X eine Gruppe der Formel -OCOCR³=CH₂ ist, worin R³ Wasserstoff, eine Methylgruppe oder eine Ethylgruppe ist, n einen Wert von 2 bis 5 aufweist und m einen Wert von 8 bis 50 aufweist.

Revendications

1. Composition durcissable comprenant un additif qui est un polysiloxane comprenant au moins une unité (i) R_a-SiO_{(4-a)/2} et au moins une unité (ii) R_bR¹SiO_{(3-b)/2} dans lesquelles R représente un groupe hydrocarboné ou hydrocarboné substitué monovalent de 1 à 12 atomes de carbone, R¹ représente un groupe de formule -(CH₂)_n(OR²)_mX dans laquelle R² est une unité alkylène de 2 ou 3 atomes de carbone, a est égal à 0, 1, 2 ou 3 et b est égal à 0, 1 ou 2, **caractérisée en ce que** X est un groupe de formule -OCOCR³=CH₂ dans laquelle R³ est un atome d'hydrogène, un groupe méthyle ou un groupe éthyle, n a une valeur comprise entre 2 et 5 et m a une valeur comprise entre 8 et 50.
2. Composition durcissable selon la revendication 1, **caractérisée en outre en ce qu'**au moins une unité (ii) dans laquelle b est égal à 2 est présente dans l'additif polysiloxane.
3. Composition durcissable selon la revendication 1 ou 2, **caractérisée en outre en ce que** l'additif polysiloxane est un polymère essentiellement linéaire constitué essentiellement d'unités de formule (i) dans laquelle a est égal à 2 et de deux unités (ii) dans lesquelles b est égal à 2, les unités (ii) étant présentes en tant qu'unités de blocage terminales du polysiloxane.

4. Composition durcissable selon l'une quelconque des revendications précédentes, **caractérisée en outre en ce que** la proportion en masse du groupe $-(CH_2)_n(OR^2)_mX$ dans l'additif polysiloxane est comprise entre 30 % et 70 % de la masse totale de l'additif polysiloxane.

5. Composition durcissable selon l'une quelconque des revendications précédentes, **caractérisée en outre en ce qu** l'additif polysiloxane est représenté par la formule générale

dans laquelle R, R², X, n et m ont la définition donnée ci-dessus, au moins 80 % des groupes R sont des groupes méthyle, et p est un nombre compris entre 10 et 50, à condition que la masse totale des fragments $-(CH_2)_n(OR^2)_m-X$ ne constitue pas moins de 30 % et pas plus de 70 % de la masse totale de l'additif polysiloxane.

6. Composition durcissable selon l'une quelconque des revendications précédentes, **caractérisée en ce que** la composition comprend aussi un véhicule choisi parmi des polyéthers de silicone de faible masse molaire, des diluants réactifs pour vernis de surimpression, des solvants ou des solvants aprotiques.

7. Utilisation d'un polysiloxane comprenant au moins une unité (i) $R_aSiO_{(4-a)/2}$ et au moins une unité (ii) $R_bR^1SiO_{(3-b)/2}$ dans lesquelles R représente un groupe hydrocarboné ou hydrocarboné substitué monovalent de 1 à 12 atomes de carbone, R¹ représente un groupe de formule $-(CH_2)_n(OR^2)_mX$ dans laquelle R² est une unité alkylène de 2 ou 3 atomes de carbone, a est égal à 0, 1, 2 ou 3 et b est égal à 0, 1 ou 2, et X est un groupe de formule $-OCOCH=CH_2$ dans laquelle R³ est un atome d'hydrogène, un groupe méthyle ou un groupe éthyle, n a une valeur comprise entre 2 et 5 et m a une valeur comprise entre 8 et 50, comme additif réduisant les frottements dans des compositions durcissables, en particulier dans des compositions de revêtement durcissables aux UV.

8. Procédé de formation d'un polysiloxane comprenant au moins une unité (i) $R_aSiO_{(4-a)/2}$ et au moins une unité (ii) $R_bR^1SiO_{(3-b)/2}$ dans lesquelles R représente un groupe hydrocarboné ou hydrocarboné substitué monovalent de 1 à 12 atomes de carbone, R¹ représente un groupe de formule $-(CH_2)_n(OR^2)_mX$ dans laquelle R² est une unité alkylène de 2 ou 3 atomes de carbone, a est égal à 0, 1, 2 ou 3 et b est égal à 0, 1 ou 2, et X est un groupe de formule $-OCOCH=CH_2$ dans laquelle R³ est un atome d'hydrogène, un groupe méthyle ou un groupe éthyle, n a une valeur comprise entre 2 et 5 et m a une valeur comprise entre 8 et 50, **caractérisé en ce que** le procédé comprend les étapes selon lesquelles (I) on fait réagir un polysiloxane (B) ayant des unités de formule $R_aSiO_{(4-a)/2}$ (i) et $R_bHSiO_{(3-b)/2}$ (iii) avec un hydroxypolyoxyalkylène insaturé de formule $CH_2=CHR^4_q(OR^2)_mOH$ en présence d'un catalyseur à base d'un métal noble, et (II) on fait réagir le produit avec un anhydride d'acide carboxylique de formule

où R³ a la définition donnée ci-dessus, R⁴ est un groupe méthylène, q est égal à 0 ou 1 et m est un nombre compris entre 8 et 50.

9. Procédé selon la revendication 8, **caractérisé en outre en ce que** l'étape (I) est une réaction d'hydrosilylation, catalysée par un métal noble, d'un polysiloxane (B) avec un polyoxyalkylène insaturé $CH_2=CHR^4_q(OCH_2CH_2)_mOH$ à une température de 50 à 150°C, et **en ce que** l'étape (II) s'effectue à une température de 60 à 110°C.

10. Composition de vernis de surimpression **caractérisée en ce que** la composition comprend une composition selon l'une quelconque des revendications 1 à 6 et comprend en outre des polymères polyacrylés choisis parmi des polyester-acrylates, des époxyacrylates et des uréthane-acrylates.

11. Composition de vernis de surimpression selon la revendication 10, **caractérisée en outre en ce qu** l'additif

polysiloxane est présent en une quantité de 0,1 à 3,0 % en masse par rapport à la masse totale de la composition.

12. Procédé de revêtement d'un substrat avec une composition durcissable selon l'une quelconque des revendications 1 à 6 ou une composition de vernis de surimpression selon la revendication 10 ou 11, **caractérisé par** l'application de la composition durcissable sur le substrat, suivie du durcissement du revêtement sur le substrat par exposition de la composition appliquée à un rayonnement ultraviolet ou un rayonnement de faisceau d'électrons.

13. Procédé pour améliorer le brillant d'un vernis de surimpression, **caractérisé en ce qu'il** comprend l'incorporation dans le vernis de 0,1 à 2 % en masse, par rapport à la composition totale du vernis, d'un additif polysiloxane comprenant au moins une unité (i) $R_aSiO_{(4-a)/2}$ et au moins une unité $R_bR^1SiO_{(3-b)/2}$ (ii) dans lesquelles R représente un groupe hydrocarboné ou hydrocarboné substitué monovalent de 1 à 12 atomes de carbone, R^1 représente un groupe de formule $-(CH_2)_n(OR^2)_mX$ dans laquelle R^2 est une unité alkylène de 2 ou 3 atomes de carbone, a est égal à 0, 1, 2 ou 3 et b est égal à 0, 1 ou 2, et X est un groupe de formule $-OCOCR^3=CH_2$ dans laquelle R^3 est un atome d'hydrogène, un groupe méthyle ou un groupe éthyle, n a une valeur comprise entre 2 et 5 et m a une valeur comprise entre 8 et 50.
